0029 1 FACILITY: DECnet-VAX Network Maintenance Operations Module
0030 1
0031 1
0032 1 ABSTRACT:
0033 1 This module contains all global data referenced by the
0034 1 Maintenance Operations Module (MOM).
0035 1
0036 1 ENVIRONMENT: VAX/VMS Operating System
0037 1
0038 1 AUTHOR: Kathy Perko
0039 1
0040 1 CREATION DATE: 17-Dec-1982
0041 1
0042 1 MODIFIED BY:
0043 1 V03-004 MKP0004 Kathy Perko 21-July-1984
0044 1 Use MOM$K_MAX_MOP_MSG_LEN instead of literals in descriptors.
0045 1 This falls out as part of fix for LOOP CIRC on point-to-point
0046 1 lines.
0047 1
0048 1 V03-003 MKP0003 Kathy Perko 20-May-1984
0049 1 Add QNA device to table used to construct secondary and
0050 1 tertiary load file names which are not supplied in the node
0051 1 database.
0052 1
0053 1 V03-002 MKP0002 Kathy Perko 11-April-1984
0054 1 Add buffer for Network Management version checking.
0055 1
0056 1 V03-001 MKP0001 Kathy Perko 20-Jan-1984
0057 1 Add SERVICE NODE VERSION parameter.
```

Data for service operations

```
101 0099 1 XSBTTL 'Data for service operations'
102 0100 1
103 0101 1 The following data is used to store information needed for maintenance
104 0102 1 operations such as LOAD, DUMP, TRIGGER, and line loop.
105 0103 1
106 0104 1
107 0105 1 GLOBAL BIND
108 0106 1
109 0107 1 Network device name - used to assign a channel to NETACP for getting
110 0108 1 information from the volatile database.
111 0109 1
112 0110 1 MOMSGQ_NETNAMDSC = $ASCID ('_NET:'),
113 0111 1
114 0112 1 Service device name - used to assign a channel to the device. QIOs to
115 0113 1 this device will send MOP messages to the target node and receive the
116 0114 1 response MOP messages.
117 0115 1
118 0116 1 MOMSGQ_DLE_NAMDSC = $ASCID ('_ND:'),
119 0117 1
120 0118 1 PSI device name - used to assign a channel to PSI for issuing loop
121 0119 1 line QIOs.
122 0120 1
123 0121 1 MOMSGQ_PSINAMDSC = $ASCID ('_NW:');
124 0122 1
125 0123 1
126 0124 1 The following fields are used for parsing NICE commands requesting
127 0125 1 service operations.
128 0126 1
129 0127 1 GLOBAL
130 0128 1 MOMSGL_SVD_INDEX, ! Index for parameter's entry in the
131 0129 1 ! Service Data Table.
132 0130 1 MOMSGB_FUNCTION: BYTE, ! NICE message function code.
133 0131 1 MOMSGB_OPTION_BYTE: BYTE; ! NICE message option byte.
134 0132 1
135 0133 1
136 0134 1 NPARSE argument block - this block is used during parsing of NICE messages
137 0135 1 to keep track of how far into the message the parsing is, and the value and
138 0136 1 length of the field currently being parsed.
139 0137 1
140 0138 1 GLOBAL
141 0139 1 MOM$AB_NPARSE_BLK: $NPA_BLKDEF;
142 0140 1
143 0141 1 GLOBAL
144 0142 1
145 0143 1 The maintenance entity code can be any one of the following values:
146 0144 1
147 0145 1 MOMSC_LINE
148 0146 1 MOMSC_CIRCUIT
149 0147 1 MOMSC_NODE
150 0148 1 MOMSC_NODEBYNAME
151 0149 1
152 0150 1 MOMSGB_ENTITY_CODE : BYTE, ! Maintenance entity code (key)
153 0151 1
154 0152 1 The entity id string is the data used as the key into the volatile data
155 0153 1 base to get information for the maintenance operation. The contents of the
156 0154 1 buffer are determined by the value of the entity id code.
157 0155 1
```

Data for service operations

```
: 158      0156 1 | MOMSC_LINE      contains line name.
: 159      0157 1 | MOMSC_CIRCUIT   contains circuit name.
: 160      0158 1 | MOMSC_NODE      contains node address (always a word).
: 161      0159 1 | MOMSC_NODEBYNAME contains node name.
: 162      0160 1 |
: 163      0161 1 | MOM$AB_ENTITY_BUF : BBLOCK [32], ! Entity id string buffer
: 164      0162 1 |
: 165      0163 1 | The service id descriptor describes the extent of the entity id in
: 166      0164 1 | the service id buffer.
: 167      0165 1 |
: 168      0166 1 | MOM$GQ_ENTITY_BUF_DSC : VECTOR [2] ! Maintenance id descriptor
: 169      0167 1 | INITIAL (0, MOM$AB_ENTITY_BUF);
: 170      0168 1 |
: 171      0169 1 |
: 172      0170 1 | Service flags. These flags are set to indicate various options in
: 173      0171 1 | use by the current service operation. The options bits are described
: 174      0172 1 | in MOMDEF.MDL.
: 175      0173 1 |
: 176      0174 1 | GLOBAL
: 177      0175 1 | MOM$GL_SERVICE_FLAGS;
: 178      0176 1 |
: 179      0177 1 |
: 180      0178 1 | For autoservice functions, MOM logs events to indicate the status
: 181      0179 1 | of the operation. This serves the same function as the NICE response
: 182      0180 1 | message for operator service functions. The event to logged is kept
: 183      0181 1 | in the following fields, and when completion (successful or not) is
: 184      0182 1 | signalled, the event is logged by the condition handler.
: 185      0183 1 |
: 186      0184 1 | Three different events can be logged:
: 187      0185 1 |
: 188      0186 1 | Automatic line service      0.3
: 189      0187 1 | Aborted service request     0.7
: 190      0188 1 | Passive loopback            0.6
: 191      0189 1 |
: 192      0190 1 | GLOBAL
: 193      0191 1 | MOM$GB_EVT_POPR : BYTE,      ! Passive loopback operation code
: 194      0192 1 | MOM$GB_EVT_PRSN : BYTE,      ! Aborted service request reason code
: 195      0193 1 | MOM$GB_EVT_PSER : BYTE,      ! Automatic line service request code
: 196      0194 1 | MOM$GW_EVT_CODE : WORD;      ! Event code
: 197      0195 1 |
: 198      0196 1 |
```

277 0273 1 *****
278 0274 1
279 0275 1 Service Data Table
280 0276 1   For any MOP maintenance operation, certain node and circuit
281 0277 1   parameters are need. These parameters are retrieved from the
282 0278 1   volatile database saved in this table. Then, if there is a NICE
283 0279 1   command, any parameters specified there overwrite the ones from the
284 0280 1   volatile database. These parameters are then used to perform the
285 0281 1   requested service function.
286 0282 1
287 0283 1 Each parameter's entry in the Service Data Table contains the following
288 0284 1 information:
289 0285 1   SVD$NFB_ID - The NFB field ID (used to identify the parameter to
290 0286 1   NETACP).
291 0287 1   SVD$NICE_ID - The NICE parameter ID (used to identify the parameter
292 0288 1   in the command from NCP).
293 0289 1   SVD$NICE_TYPE - The parameter's type (byte, word, longword, or
294 0290 1   string) in the NICE message.
295 0291 1   SVD$FLAGS - There's only one flag, SVD$MSG_PARAM, which is set
296 0292 1   if the parameter value in this entry was obtained from
297 0293 1   the NICE or MOP message specifying parameters for the
298 0294 1   current operation.
299 0295 1   SVD$STRING_LEN - Byte length of the parameter if it's a string.
300 0296 1   SVD$PARAM - The parameter value.
301 0297 1   SVD$STRING - The string.

```
334 0330 1 SVD_INDEX = 0;
335 0331 1
336 0332 1
337 0333 1
338 0334 1
339 0335 1 Some of the entries in the Service Data table do not have convenient entries
340 0336 1 in the volatile database or in the NICE protocol. They are useful pieces of
341 0337 1 information to keep around during the maintenance operation. So pseudo
342 0338 1 names are used for their entries in the SVD.
343 0339 1
344 0340 1 The values all have bit 15 set, indicating a counter value, to avoid
345 0341 1 conflicts with other network management parameter codes.
